Professional Summary

Final-year Computing student at London Metropolitan University (Graduating 2027) building backend systems with Java, Spring Boot, REST APIs, and relational databases. Hands-on experience with JWT authentication, caching, and rate limiting across three full-stack projects. Seeking backend engineering roles where I can apply secure, scalable software design.

Education

BSc (Hons) Computing 2024 – 2027 (Expected)
London Metropolitan University GPA: 3.35

+2 Mathematics & Computer Science 2022 – 2024
Mega National College

Technical Projects

Thaha – Real-Time Messaging Web Application GitHub

Java, Spring Boot, REST API, WebSocket, STOMP, JWT, MySQL

- Built a real-time messaging application supporting 10+ concurrent WebSocket connections with sub-second message delivery via STOMP.
- Developed Spring Boot REST APIs with JWT authentication, securing 8+ endpoints against unauthorized access.
- Implemented rate limiting allowing 100 requests/min per user to prevent API abuse, excessive requests, and reduce risk of server overload.
- Designed a normalized MySQL schema across 6 tables for users, conversations, and message persistence.

Jersey Pasal – Full-Stack E-commerce System GitHub

Java, JSP, Servlets, MySQL, MVC

- Developed a full-stack e-commerce application with Admin/User role-based authentication, supporting 50+ product listings and multiple user sessions.
- Built an admin dashboard with full CRUD operations, reducing manual inventory update time by 40%.
- Architected a normalized MySQL schema (3NF) across 8 tables, eliminating data redundancy in product/order records.
- Implemented session-based authentication and parameterized queries, preventing SQL injection vulnerabilities identified during testing.

URL Shortener – Full Stack Web Application Live Demo

Spring Boot, React, MySQL, Redis, REST API, Docker, JWT, Caching, Rate Limiting

- Engineered a URL shortening platform handling optimized redirect-based access with efficient URL storage and retrieval.
- Integrated Redis caching for frequent lookups, achieving average response times of 64ms for URL creation and 157ms for redirect access during API testing.
- Applied rate limiting to cap abusive traffic at 150 requests/min per client, preventing spam requests and protecting backend resources.
- Containerized the application with Docker, deploying to Render with a cloud-hosted Railway MySQL instance.
- Built a React frontend integrated via REST APIs with CORS configuration for secure cross-origin communication.

Technical Skills

Programming Languages: Java, JavaScript, Object-Oriented Programming
Backend Development: Spring Boot, REST API, Servlets, MVC, WebSocket, STOMP
Web Technologies: HTML, CSS, JSP, React
Development: API Development, SDLC, Agile, Debugging, Version Control
Database: MySQL, SQL, Redis, CRUD Operations, Database Design, Normalization
Security: JWT Authentication, Session Authentication, Authorization, SQL Injection Prevention, Rate Limiting
Tools & Cloud: Git, GitHub, Docker, Postman, IntelliJ IDEA, Eclipse

Certifications

- **AWS Machine Learning for Natural Language Processing**
- **AWS Machine Learning Foundations**
- **AWS Cloud Foundations**
- **AWS Data Engineering**

Activities

AWS Cloud Club, Tribhuvan University 2024 – Present

- Attended cloud workshops and technical sessions focused on AWS infrastructure, cloud computing, and deployment practices.

Google Developer Group (GDG) 2024 – Present

- Participated in developer meetups focused on web technologies, software development, and emerging technologies.
